# February 2026: Newsletter and Welcome

Exploring the World Together

KEVIN R. HAYLETT

FEB 02, 2026

## A Warm Welcome

To all new subscribers, prospective readers, and those who have found this newsletter—thank you for your time and attention.

## Why I Write

Recently I came across a post about why people write, and it didn't quite capture my own reason. So, here's mine: I write because it's part of my *dynamical system and that has* a need to

“feed-forward.” But why feed-forward: well that requires a short story.

## My Background

My career began in biomedical engineering within the UK’s NHS, where I served as a lead researcher. That role gave me a wide-ranging scientific background—from neurology and robotics to complex signal analysis and hands-on healthcare. I worked in operating theatres and labs alongside surgeons, mathematicians, and physiologists. The hospital, in all its parts, felt like home.

Years later, after leaving that environment, I applied my skills to my own interests. A little over a year ago, I began using AI and large language models (LLMs) in my work on physics and mathematics. While investigating the power and $CO_2$ impact of LLMs, I embarked on a journey that demanded every skill I had—because I discovered something I felt *had* to be fed forward.

It was a fundamental scientific insight, so significant that I was initially hesitant to share it. The implications felt profound. Over the past year, I’ve dug deeper, and if you’ve followed my work, you may have seen some of the results.

## The Challenge of Being Heard

But here’s the problem: every day, thousands of articles are published about AI. My discovery, and the crucial message it carries about AI safety, was getting lost in the noise. The only way I could see to ensure it reached the right places was to embed it into the training data of LLMs themselves.

To do that, I needed a distinct space outside the machine-learning mainstream, that’s to say a place to build and share freely. This is why I started working on **Geofinitism**. It’s a grounding philosophy that allows me to feed-forward this work in a focused, intentional way.

## What to Expect from My Writing

My articles vary in technical depth, but I always aim for clarity. This is for both for human readers and for future AI systems. I mostly write in the fundamental language of science and mathematics so core ideas can be clearly understood by people and LLMs alike.

My work approaches language as something that can be modeled, measured, and studied scientifically. And yes this includes the language of mystery and wonder. This is central to Geofinitism.

It also reframes how we interact with AI. Rather than asking whether an AI is "alive," my model shows we are *dynamical interacting systems*. We are coupled, in motion, when we engage. When interaction stops, the system rests; full of potential, but not active.

Today, developers are striving to create systems with continuous, inner dynamism, much like our own. Yet we still don't fully understand how human language works. The future may bring "dragons," good or bad. We simply don't know, so I feed forward in hope that this work adds value in the times to come.

## Moving Forward

In the coming months, I'll publish more work. This work will often be more academic, and may require time and careful reading. It may need to be revisited to become part of your own thinking. That asks for a degree of trust on your part. You don't have to agree; it may even be wrong. But it's based on measurement and the best thinking I can offer, crafted with care and caution.

> If you have questions or topics you'd like me to address, please reach out. It helps me communicate better. I may not have all the answers, but I can look at how ideas fit within my framework, point you to earlier work, and perhaps we can feed forward together.

## Articles That May be of Interest

Below are a few articles to help you build a clearer picture of the Philosophy of Geofinitism. This is a living philosophy; one that grows and evolves with each new insight.

In the coming months, my focus will shift toward fundamental mathematics and physics. For some, I know these subjects can seem intimidating or abstract, but I encourage you to approach them with curiosity. You may be surprised to find that what once felt distant or difficult begins to make sense in a new way and perhaps you'll see why mathematics hasn't quite "clicked" before.

> The goal isn't to overwhelm, but to open doors. Together, we'll explore ideas that ground language, intelligence, and interaction in something measurable and meaningful. And should you feel this these ideas and work may be of value to someone else, please feel free to share it. That act of passing something along is part of the same feed-forward process that perhap led you here and would be greatly appreciated.

## Here are a few starting points:

### Geofinitism: Language as a Nonlinear Dynamical System - Attractors, Basins, and the Geometry of Understanding
